RESTful Endpoint Architecture

Following REST best practices, API endpoints should use resource-oriented URLs (using plural nouns) combined with standard HTTP verbs (GET, POST, PUT, PATCH, DELETE).

Resource	HTTP Method	Endpoint URL	Description
Products	GET	/api/products/	List all products (with optional filtering by store or category).
	GET	/api/products/{id}/	Retrieve details of a specific product.
Stores	GET / POST	/api/stores/	List stores or create a new store (Vendors only).
	PUT / DELETE	/api/stores/{id}/	Update or remove a vendor's store.
Cart	GET / POST	/api/cart/	View current cart items or add a product to the cart.
Orders	POST	/api/orders/checkout/	Trigger checkout, clear cart, generate invoice, and queue email.
Reviews	GET / POST	/api/reviews/	List reviews or submit a new review (auto-flagging verified vs. unverified).
